

(The exam in the preclinical complete denture book)

Choose the correct answer:

1- A prominent.....may cause rocking of the upper denture.

- a- rugae area
- b- median palatine raphe
- c- maxillary tuberosity
- d- retromolar pad

2- Theaids in orientation of the posterior occlusal plane.

- a- ala-tragus line
- b- interpupillary line
- c- Vibrating line
- d- Ah-line

3- Mean value articulators can accept

- a- right lateral record
- b- left lateral record
- c- Protrusive record
- d- none of the above

4- Direct relief of the denture can be accomplished by

- a- scraping the cast
- b- scraping the final impression
- c- a selective pressure impression
- d- none of the above

5- Factors to be considered in selection of anterior teeth:

- a- shade of the teeth
- b- form of the teeth
- c- Size of the teeth
- d- all of the above

6- Acrylic teeth bond to the denture base by:

- a- mechanical means
- b- using special type of adhesive
- c- Chemical means
- d- all of the above

7- The overjet is:

- a- the horizontal overlap between the upper and lower anterior teeth
- b- the vertical overlap between the upper and lower anterior teeth

c- The reversed occlusion principle

d- all of the above

8- Depth of the post dam depends on:

- a- thickness of the acrylic resin in the fitting surface of the denture
- b- compressibility of soft tissues in immovable part of the soft palate

- c- Compressibility of soft tissues covering the hard palate
- d- The curvature of the soft palate whether gentle, medium, or abrupt.

9- Choose the correct rule of finding vertical dimension at rest?

- a- Vertical at occlusion + free-way space + Maxillary height.
- b- Vertical at occlusion - free-way space + Maxillary height.
- c- Vertical at occlusion + free-way space.
- d- Vertical at occlusion - free-way space.

10- The genial tubercles

- a- they represent the attachment of geniohyoid and genioglossus muscles.
- b- If it's prominent, it should be relieved.
- c- Two bony projections at midline of each side of symphysis.
- d- all of the above.

11-The function of the posterior palatal seal is:

- a- To aid in balanced occlusion.
- b- To aid in insertion and removal of complete denture.
- c- To ensure a complete seal thus helping in retention of a denture.
- d- Retention of mandibular denture by sealing its posterior margin.

12- Residual alveolar ridge in the upper jaw considered

- a- secondary stress-bearing area .
- b- Primary stress-bearing area.
- c- Non stress-bearing area.
- d- Wrong stress-bearing area.

13- Philtrum

- a- diamond shaped depression at the center of the upper lip and base of the nose
- b- After loss of teeth, the philtrum becomes deepened.
- c- Wrong stress-bearing area.
- d- None of the above.

14- Retention is defined as:

- a- The vertical movement of the denture.
- b- Resistance to vertical tissue away movement.
- c- Tissue away movement of the denture.
- d- None of the above.

15- Buccal shelf area Used as 1ry stress bearing area because:

- a- Parallel to the vertical masticatory force.
- b- Formed from compact bone.
- c- Provide retention.
- d- all of the above.
